# Chapter 1

# Revision of Probability

I'm simply gonna list rules.

$$\begin{split} \mathbb{E}(X) &= \mu = \sum_{i \in \Omega} X_i \mathrm{Pr}\left(X_i\right) \\ \mathbb{E}(g(X)) &= \sum_{i \in \Omega} g(X_i) \mathrm{Pr}\left(X_i\right) \\ \mathbb{E}(aX + b) &= a\mathbb{E}(X) + b \\ \mathbb{E}(X + Y) &= \mathbb{E}(X) + \mathbb{E}(Y) \quad \text{if both variables are independent} \end{split}$$

$$\begin{aligned} \operatorname{Var}(X) &= \sigma^2 = \mathbb{E}(X^2) - \mu^2 \\ \operatorname{Var}(aX + bY) &= a^2 \operatorname{Var}(X) + b^2 \operatorname{Var}(Y) + 2ab \operatorname{cov}(X, Y) \end{aligned}$$

where

$$cov(X, Y) = \mathbb{E}(XY) - \mathbb{E}(X) \cdot \mathbb{E}(Y).$$

#### 1.1 Discrete Distributions

1. Uniform discrete law

$$X(\Omega) = \{1, 2, 3, \dots, n\}$$

$$\Pr(X = k) = \frac{1}{n} \quad \forall k = 1, 2, 3, \dots, n$$

$$\begin{cases} \mathbb{E}(X) = \frac{n+1}{2} \\ \text{Var}(X) = \frac{n^2 - 1}{12} \end{cases}$$

2. Bernoulli law of parameters p (0 < p < 1)

$$\begin{split} X \sim \mathrm{B}(p) \\ X(\Omega) &= \{0,1\} \\ \mathrm{Pr}\left(X=1\right) &= p \quad \mathrm{Pr}\left(X=0\right) = 1-p \\ \left\{\mathbb{E}(X) &= p \\ \mathrm{Var}\left(X\right) &= p(1-p) \right. \end{split}$$

3. Binomial law of parameters n and p

$$\begin{split} & X \sim \operatorname{Bin}(n,p) \\ & X(\Omega) = \{1,2,\ldots,n\} \\ & \operatorname{Pr}\left(X=1\right) = C_n^k p^k q^{n-k} \quad \forall k \in \{0,1,2,\ldots,n\} \\ & \begin{cases} \mathbb{E}(X) = np \\ \operatorname{Var}\left(X\right) = np(1-p) \end{cases} \end{split}$$

4. Hypergeometric law

$$\begin{split} &X \sim \mathcal{H}(N,n,p) \\ &X(\Omega) = \left[ \max\{0,n-N+M\}, \min\{M,n\} \right] \\ &\Pr\left( X = k \right) = \frac{C_M^k \cdot C_{N-M}^{n-k}}{C_N^n} \quad \forall k \in X(\Omega) \\ &\left\{ \mathbb{E}(X) = np \\ &\operatorname{Var}\left( X \right) = np(1-p) \left( \frac{N-n}{N-1} \right) \right. \end{split}$$

5. Geometric law

$$\begin{split} & X \sim \mathrm{G}(p) \\ & X(\Omega) = \mathbb{N}^* \\ & \Pr\left(X = k\right) = p(1-p)^{k-1} \quad \forall k \in \mathbb{N}^* \\ & \begin{cases} \mathbb{E}(X) = \frac{1}{p} \\ \mathrm{Var}\left(X\right) = \frac{1-p}{p^2} \end{cases} \end{split}$$

6. Poisson's law of parameter  $\lambda$  ( $\lambda \in \mathbb{R}_+^*$ )

$$\begin{split} X &\sim \mathcal{P}(\lambda) \\ X(\Omega) &= \mathbb{N} \\ \Pr\left(X = k\right) = e^{-\lambda} \frac{\lambda^k}{k!} \quad \forall k \in \mathbb{N} \\ \left\{ \mathbb{E}(X) = \lambda \right. \\ \operatorname{Var}(X) &= \lambda \end{split}$$

#### 1.2 Continuous Distributions

1. Uniform law

$$f(x) = \begin{cases} \frac{1}{b-a} & \text{if } x \in [a,b] \\ 0 & \text{else} \end{cases}$$
$$\begin{cases} \mathbb{E}(x) = \frac{a+b}{2} \\ \text{Var}(x) = \frac{(b-a)^2}{12} \end{cases}$$

2. Exponential law

$$x \sim \xi(\lambda)$$

$$f(x) = \begin{cases} \lambda e^{-\lambda x} & \text{if } x > 0\\ 0 & \text{else} \end{cases}$$

$$\begin{cases} \mathbb{E}(x) = \frac{1}{\lambda} \\ \text{Var}(x) = \frac{1}{\lambda^2} \end{cases}$$

#### 3. Normal law

$$x \sim \mathcal{N}(\mu, \sigma)$$
$$f(x) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$
$$\begin{cases} \mathbb{E}(x) = \mu \\ \text{Var}(x) = \sigma^2 \end{cases}$$

For  $\mathcal{N}(0,1)$ 

$$\Phi(z) = \int_{-\infty}^{z} \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx.$$

$$\pi(z) = \Phi(z) - 0.5 = \int_{0}^{z} \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx.$$

### 1.3 Convergence

#### Theorem 1.3.1 Chebyshev's inequality

Let X be a random variable of expectation  $\mathbb{E}(X)$  and variance  $\mathrm{Var}(X)$ . Then  $\forall \varepsilon$ 

$$\Pr\left(\left|X-\mathbb{E}(X)\right| \geq \varepsilon\right) \leq \frac{\operatorname{Var}\left(X\right)}{\varepsilon^{2}}.$$

it can also be stated as

$$\Pr(|X - \mathbb{E}(X)| < \varepsilon) \ge 1 - \frac{\operatorname{Var}(X)}{\varepsilon^2}.$$

We say a sequence of random variables  $X_n$  converges to a  $(X_n) \xrightarrow{\Pr} a$  if  $\forall \varepsilon$ 

$$\lim_{n \to +\infty} \Pr\left(|X_n - a| > \varepsilon\right) = 0.$$

or

$$\lim_{n \to +\infty} \Pr\left(|X_n - a| \le \varepsilon\right) = 1.$$

#### **Theorem 1.3.2** Weak law of large numbers

Consider a random variable  $(X_n)$  of mean  $\mu$  and variance  $\sigma^2$ . Consider the random variable  $\tilde{X}_n = \frac{X_1 + X_2 + \dots + X_n}{n}$ . It can be shown that  $\tilde{X}_n$  converges to  $\mu$  meaning  $\forall \varepsilon$ 

$$\lim_{n \to +\infty} \Pr\left(|\tilde{X}_n - \mu| > \varepsilon\right) = 0.$$

# 1.4 Approximations

### Theorem 1.4.1 Binomial by a Poisson

$$\mathrm{Bin}(n,p) \sim \mathcal{P}(np) \quad \mathrm{if} \, \begin{cases} n \geq 30 \\ p \leq 0.1 \\ np < 15 \end{cases}$$

#### Theorem 1.4.2 Hypergeometric by a Binomial

$$\mathcal{H}(N, n, p) \sim \text{Bin}(n, p)$$
 if  $n \leq 0.05N$ .

#### Theorem 1.4.3 De Moivre-Laplace theorem

$$\mathrm{Bin}(n,p) \sim \mathcal{N}\left(np,\sqrt{np(1-p)}\right) \quad \mathrm{if} \ \begin{cases} n \geq 30 \\ np \geq 5 \\ n(1-p) \geq 5 \end{cases}.$$

In this case the event X = k can be replaced by k - 0.5 < X < l + 0.5

#### Theorem 1.4.4 Central limit theorem

Let  $(X_n)$  be a sequence of independent random variables following the same law of expectation  $\mu$  and of standard deviation  $\sigma$ . Let  $S_n = \sum_{i=1}^n X_i$  and  $S_n^* = \frac{S_n - n\mu}{\sigma\sqrt{n}}$ . It can be shown that  $S_n^*$  converges in law to  $\mathcal{N}(0,1)$ .

$$\mathbb{E}(S_n) = n\mu$$
$$\operatorname{Var}(S_n) = n\sigma^2$$

#### 1.5 Further laws

#### **Theorem 1.5.1** Chi square law

Let  $X_1, X_2, \ldots, X_n$  be n independent random variables following the standard normal law  $\mathcal{N}(0,1)$ . Let  $Y = {X_1}^2 + {X_2}^2 + \cdots + {X_n}^2$ . We say that Y follows a chi-square law with n degrees of freedom.  $Y \sim {\chi_n}^2$ .

$$\mathbb{E}(Y) = n$$
$$Var(Y) = 2n$$

It can be shown that the density function of Y is

$$f(x) = \begin{cases} \frac{1}{2^{\frac{n}{2}} \Gamma(\frac{n}{2})} x^{\frac{n}{2} - 1} e^{-\frac{x}{2}} & \text{if } x > 0\\ 0 & \text{else} \end{cases}.$$

where  $\Gamma$  is the gamma function

$$\Gamma(x) = \int_0^{+\infty} t^{x-1} e^{-t} dt \quad \forall x > 0.$$

#### **Theorem 1.5.2** Student law(t-distribution)

Let X, Z be two independent random variables such that  $X \sim \mathcal{N}(0,1)$  and  $Z \sim \chi_n^2$ . Hence the random variable

$$T = \frac{X}{\sqrt{\frac{Z}{n}}}.$$

5

is said to be following a student law.  $T \sim \mathcal{T}_n$ 

$$f(t) = \frac{1}{\sqrt{n\pi}} \frac{\Gamma\left(\frac{n+1}{2}\right)}{\Gamma\left(\frac{n}{2}\right)} \left(1 + \frac{t^2}{n}\right)^{-\frac{n+1}{2}}.$$

# Chapter 2

# **Estimators**

Let  $\theta$  be a certain characteristic of a population P of N individuals, for exmaple letting  $\theta$  be the expectation of a certain random variable X defined over the population. We take a sample of size n < N of the population to estimate the value of  $\theta$ .

Let  $Y_n$  be a function of the random variables  $X_1, X_2, \ldots, X_n$ .  $Y_n$  is called an estimator of  $\theta$  if

$$\lim_{n\to+\infty}\mathbb{E}(Y_n)=\theta.$$

a consistent estimator if

$$\lim_{n \to +\infty} \operatorname{Var}(Y_n) = 0.$$

and an unbiased estimator if

$$\mathbb{E}(Y_n) = \theta \quad \forall n \in \mathbb{N}^*.$$

the value  $y_n$  of  $Y_n$  computed from any observed sample is called point estimation of  $\theta$ 

#### 2.1 Point estimation of the mean

Let X be a random variable defined over the population P of the expected value  $\mu$  and standard deviation  $\sigma$ . Consider a sample  $(X_1, X_2, \ldots, X_n)$  of size n, randomly selected from P such that  $X_i$  are independent and follow the same law.

Consider the statistic  $\bar{X}_n = \frac{X_1 + X_2 + \dots + X_n}{n}$ , it is a random variable whose distribution is called the sample distribution of the mean.

$$\mathbb{E}(\bar{X}_n) = \mu$$

$$\operatorname{Var}\left(\bar{X}_{n}\right) = \frac{\sigma^{2}}{n}$$

Since  $\operatorname{Var}\left(\bar{X}_{n}\right) \xrightarrow[n \to +\infty]{} 0$  then  $\bar{X}_{n}$  is a consistent unbiased estimator of the mean  $\mu$ .

Note:-

The standard deviation of  $\bar{X}_n$  is called standard error of the mean

$$\sigma(\bar{X}_n) = \frac{\sigma}{\sqrt{n}}.$$

Due to the central limit theorem, as the sample size gets larger and larger  $\bar{X}_n$  approaches a normal distribution  $\bar{X}_n \sim \mathcal{N}\left(\mu, \frac{\sigma}{\sqrt{n}}\right)$ .

### 2.2 Point estimator of the variance

#### 2.2.1 Suppose $\mu$ is unknown

Consider the random variable  $S^2$  (estimator of  $\sigma^2$ )

$$S^{2} = \frac{1}{n} \sum_{i=1}^{n} (X_{i} - \bar{X}_{n})^{2}.$$

The expectation of  $S^2$  can be proved to be

$$\mathbb{E}(S^2) = \frac{n-1}{n}\sigma^2.$$

Since  $\mathbb{E}(S^2) \xrightarrow[n \to +\infty]{} \sigma^2$  then  $S^2$  is a biased estimator of  $\sigma^2$ .

Consider the random variable  $S'^2$ 

$$S'^{2} = \frac{n}{n-1}S^{2} = \frac{1}{n-1}\sum_{i=1}^{n} (X_{i} - \bar{X}_{n})^{2}.$$

Since  $\mathbb{E}(S'^2) = \sigma^2$  then  $S'^2$  is an unbiased estimator of  $\sigma^2$ .

Hence  $\sigma$  can be estimated by

$$S' = \sqrt{\frac{n}{n-1}}S.$$

and

$$\sigma(\bar{X}_n) = \frac{S}{\sqrt{n-1}}.$$

where

 $\sigma^2$  variance of the population.

 $S^2$  variance of the sample.

 $\sigma^2(\bar{X}_n)$  variance of the distribution of the sample mean.

 $S'^2$  corrected variance of the sample.

#### Note:-

It is better to estimate  $\sigma^2$  using  $S'^2$  than  $S^2$  since  $S^2$  is a biased estimator. However, if n (sample size) is big enough  $\left(\frac{n}{n-1}\approx 1\right)$ , then  $\sigma^2$  can be estimated by  $S^2$ 

#### 2.2.2 Suppose $\mu$ is known

Consider the random variable  $Z^2$  (not the variance of the sample)

$$Z^{2} = \frac{1}{n} \sum_{i=1}^{n} (X_{i} - \mu)^{2}.$$

Since  $\mathbb{E}(Z^2) = \sigma^2$  then  $Z^2$  is an unbiased estimator of  $\sigma^2$  thus the value  $z^2 = \frac{1}{n} \sum_{i=1}^n (x_i - \mu)^2$  is a point estimation of the variance  $\sigma^2$  of the population.

### Note:-

If n > 0.05N and if the sample is selected without replacement then the value of the variance changes to become

$$\operatorname{Var}\left(\bar{X}_{n}\right) = \left(\frac{N-n}{N-1}\right) \frac{\sigma^{2}}{n}.$$

and the standard error becomes

$$\sigma(\bar{X}_n) = \frac{\sigma}{\sqrt{n}} \sqrt{\frac{N-n}{N-1}}.$$

If the variance of the population is not known then we can use use  $S^2$  or  $Z^2$  to estimate  $\mathrm{Var}\left(\bar{X}_n\right)$ 

$$\operatorname{Var}\left(\bar{X}_{n}\right) = \left(\frac{N-n}{N-1}\right) \frac{S^{2}}{n-1}.$$

and the standard error with

$$\sigma(\bar{X}_n) = \frac{S}{\sqrt{n-1}} \sqrt{\frac{N-n}{N-1}}.$$

## 2.3 Point estimation of a proportion (percentage)

Consider a population P of individuals with a proportion p if individuals having a certain characteristic  $\theta$ . Let  $(a_1, a_2, \ldots, a_n)$  be a sample randomly selected P. We define for each individual  $a_i$  the Bernoulli random variable  $X_i$  as follows

$$\begin{cases} X_i = 1 & \text{if } a_i \text{ has the characteristic } \theta \text{ with probability } p \\ X_i = 0 & \text{else} \end{cases}$$

Let  $Y_n = \frac{X_1 + X_2 + \dots + X_n}{n} = \frac{1}{n} \sum_{i=1}^n X_i$ .  $Y_n$  is the random variable giving the proportion of individuals of the sample that have the characteristic  $\theta$ .

$$\Pr\left(X_i=1\right) = \frac{\text{number of individuals of the population having } \theta}{\text{total number of individuals}} = p$$

$$\Pr\left(X_i=0\right) = 1-p$$

Thus  $X_1 + X_2 + \cdots + X_n \sim \text{Bin}(n, p)$ 

$$\mathbb{E}(X_1 + X_2 + \dots + X_n) = np$$

$$Var(X_1 + X_2 + \dots + X_n) = np(1 - p)$$

$$\mathbb{E}(Y_n) = p$$

$$Var(Y_n) = \frac{p(1-p)}{n}$$

Hence  $Y_n$  is a consistent unbiased estimator of p. Therefore any observed value  $y_n$  of  $Y_n$  is a point estimator of P, meaning p is estimated by the proportion of the sample.

#### 2.4 Confidence interval

#### 2.4.1 Confidence interval for the mean

1. Suppose that  $n \ge 30$ , the population is normally distributed, and  $\sigma$  is known Let X be a random variable defined over a population P of mean  $\mathbb{E}(X) = \mu$  and of variance  $\text{Var}(X) = \sigma^2$ .

Here we consider that  $\bar{X}_n \sim \mathcal{N}\left(\mu, \frac{\sigma}{\sqrt{n}}\right)$ . Hence  $\frac{\bar{X}_n - \mu}{\sigma_{\bar{X}_n}} \sim \mathcal{N}(0, 1)$ .

Given the probability  $\gamma$  (level of confidence), we can find t such that

$$\Pr\left(-t \leq \frac{\bar{X}_n - \mu}{\sigma_{\bar{X}_n}} \leq t\right) = \gamma$$

$$\Pr\left(\bar{X}_n - t\sigma_{\bar{X}_n} \leq \mu \leq \bar{X}_n + t\sigma_{\bar{X}_n}\right) = \gamma$$

where  $\pi(t) = \frac{\gamma}{2}$ . Knowing  $\gamma$  we get t. Therefore a  $\gamma$ % confidence interval for the mean  $\mu$  is given by

$$IC_{\gamma}(\mu) = [\bar{x}_n - t\sigma_{\bar{X}_n}, \bar{x}_n + t\sigma_{\bar{X}_n}].$$

where

$$\sigma_{\bar{X}_n} = \begin{cases} \frac{\sigma}{\sqrt{n}} & \text{if } \sigma \text{ is known} \\ \frac{S}{\sqrt{n-1}} & \text{if } \sigma \text{ is unknown (estimated by } S' = \sqrt{\frac{n}{n-1}}S) \end{cases}.$$

#### 2. Suppose that n < 30, the population is normally distributed, and $\sigma$ is unknown:

Using the table of student distributed knowing  $\gamma$ , we determine t such that

$$\Pr\left(\bar{X}_n - t \frac{S}{\sqrt{n-1}} \le \mu \le \bar{X}_n + t \frac{S}{\sqrt{n-1}}\right) = \gamma.$$

hence the confidence inteval for the mean  $\mu$  is

$$IC_{\gamma}(\mu) = \left[\bar{X}_n - t \frac{S}{\sqrt{n-1}}, \bar{X}_n + t \frac{S}{\sqrt{n-1}}\right].$$

- (a)  $\bar{X}_n$  and  $S^2$  are two independent random variance.
- (b) The random variable  $n\frac{S^2}{\sigma^2}$  follows a chi-square law with n-1 degrees of freedom.

#### Theorem 2.4.2

The random variable

$$\tilde{T} = \frac{\bar{X}_n - \mu}{\frac{S'}{\sqrt{n}}} = \frac{\bar{X}_n - \mu}{\frac{S}{\sqrt{n-1}}}.$$

follows a student law (t-distribution) with n-1 degrees of freedom

#### 3. Suppose that n < 30, the population is not normally distributed:

In this case we cannot use the normal distributed nor the student distribution. However we can use Chebyshev's inequality.

$$\Pr\left(|\bar{X}_n - \mu| \le \varepsilon\right) \ge 1 - \frac{\sigma_{\bar{X}_n}^2}{\varepsilon^2}.$$

Take  $\varepsilon = t\sigma_{\bar{X}}$ .

$$\Pr\left(\bar{X}_n - t\sigma_{\bar{X}_n} \leq \mu \leq \bar{X}_n + t\sigma_{\bar{X}_n}\right) \geqslant 1 - \frac{1}{t^2}.$$

Then we set  $1 - \frac{1}{t^2}$  equal to  $\gamma$  solve for t and find the interval as follows

$$\mathrm{IC}_{\gamma} = [\bar{x}_n - t\sigma_{\bar{X}_n}, \bar{x}_n + t\sigma_{\bar{X}_n}].$$

- if  $\sigma$  is known then  $\sigma_{\bar{X}_n} = \frac{\sigma}{\sqrt{n}}$
- if  $\sigma$  is unknown then we replace  $\sigma_{\bar{X}_n}$  by its point estimator  $\frac{S'}{\sqrt{n}} = \frac{S}{\sqrt{n-1}}$

### Confidence interval for a proportion (precentage)

same setup as last time. If we assume this time that  $Bin(n,p) \approx \mathcal{N}\left(np,\sqrt{np(1-p)}\right)$  if  $(n \ge 30,\ np,n(1-p) \ge 5)$ then we can say  $Y_n \sim \mathcal{N}\left(p, \sqrt{\frac{p(1-p)}{n}}\right)$ . Knowing  $\gamma$  we can determine t such that

$$\Pr\left(-t \leqslant \frac{Y_n - p}{\sigma_{Y_n}} \leqslant t\right) = \gamma.$$

The confidence interval becomes

$$[y_n - t\sigma_{Y_n}, y_n + t\sigma_{Y_n}].$$

where  $\sigma_{Y_n} = \sqrt{\frac{p(1-p)}{n}}$  estimated by

$$\sqrt{\frac{n}{n-1}}\sqrt{\frac{y_n(1-y_n)}{n}}=\sqrt{\frac{y_n(1-y_n)}{n-1}}.$$

Therefore the confidence interval becomes

$$\mathrm{IC}_{\gamma}(p) = \left[y_n - t\sqrt{\frac{y_n(1-y_n)}{n-1}}, y_n + t\sqrt{\frac{y_n(1-y_n)}{n-1}}\right].$$

Note:If  $n \ge 100$  then  $\frac{n}{n-1} \approx 1$ , then the confidence interval is

$$\left[y_n-t\sqrt{\frac{y_n(1-y_n)}{n}},y_n+t\sqrt{\frac{y_n(1-y_n)}{n}}\right].$$

Note:-

If the sample is selected without replace and if n > 0.05N then we shall put a correcting factor  $\frac{N-n}{N-1}$  to  $\sigma_{Y_n} = \sqrt{\frac{p(1-p)}{n}}$ , thus the confidence interval for proportion p becomes

$$\left[y_{n}-t\sqrt{\frac{N-n}{N-1}}\sqrt{\frac{y_{n}(1-y_{n})}{n-1}},y_{n}+t\sqrt{\frac{N-n}{N-1}}\sqrt{\frac{y_{n}(1-y_{n})}{n-1}}\right].$$

#### Confidence interval for the variance

Assume  $X \sim \mathcal{N}(\mu, \sigma)$  and  $X_1, X_2, \dots, X_n$  independent random variables and identically distributed as X. We set the variables

$$\bar{X}_n = \frac{1}{n} \sum_{i=1}^n X_i$$

$$S^2 = \frac{1}{n} \sum_{i=1}^n (X_i - \bar{X}_n)^2$$

$$S'^2 = \frac{n}{n-1} S^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X}_n)^2$$

$$Z^2 = \frac{1}{n} \sum_{i=1}^n (X_i - \mu)^2$$

we have

$$\bar{X}_n \sim \mathcal{N}\left(\mu, \frac{\sigma}{\sqrt{n}}\right)$$

$$n\frac{S^2}{\sigma^2} \sim \chi_{n-1}^2$$

$$n\frac{Z^2}{\sigma^2} \sim \chi_n^2$$

#### 1. Suppose $\mu$ is unknown

Since  $n\frac{S^2}{\sigma^2} \sim \chi_{n-1}^2$ , then we determine the values  $v_{\alpha/2}$  and  $v_{1-\alpha/2}$  from the chi-square table such that

$$\Pr\left(v_{\alpha/2} \leq \frac{nS^2}{\sigma^2} \leq v_{1-\alpha/2}\right) = \gamma = 1-\alpha.$$

therefore a confidence interval of level  $\gamma$  (risk  $\alpha$ ) is given by

$$IC_{\gamma}(\sigma^2) = \left[\frac{nS^2}{v_{1-\alpha/2}}, \frac{nS^2}{v_{\alpha/2}}\right] = \left[\frac{(n-1)S'^2}{v_{1-\alpha/2}}, \frac{(n-1)S'^2}{v_{\alpha/2}}\right].$$

#### 2. Suppose $\mu$ is known

From the chi-square table, we determine the values of the quantities  $v_{\alpha/2}$  and  $v_{1-\alpha/2}$  for the law  $\chi_n^2$  such that

$$\Pr\left(v_{\alpha/2} \leq \frac{nZ^2}{\sigma^2} \leq v_{1-\alpha/2}\right) = \gamma.$$

Therefore the confidence interval of level  $\gamma$  is given by

$$\operatorname{IC}_{\gamma}(\sigma^2) = \left[\frac{nz^2}{v_{1-\alpha/2}}, \frac{nz^2}{v_{\alpha/2}}\right].$$

## 2.5 Mean Squared Error

Consider the estimator  $y_n = f(x_1, x_2, \dots, x_n)$  of  $\theta$ . The bias of  $y_n$  relative to  $\theta$  is

$$Bias(y_n) = \mathbb{E}(y_n) - \theta.$$

The mean squared error of  $y_n$  with respect to  $\theta$  is

$$\mathrm{MSE}(y_n) = \mathbb{E}\left[(y_n - \theta)^2\right].$$

It can also be shown that

$$MSE(y_n) = Var(y_n) + Bias(y_n)^2$$

If  $y_n$  is an unbiased estimator of  $\theta$  then  $\mathrm{Bias}(y_n) = \mathbb{E}(y_n) - \theta = 0 \Longrightarrow$ 

$$MSE(y_n) = Var(y_n)$$
.

Assume  $y_n$  and  $z_n$  are two estimators of the same parameter  $\theta$ . We say  $y_n$  is more efficient than  $z_n$  if

$$MSE(y_n) < MSE(z_n)$$
.

Assume  $y_n$  and  $z_n$  are two unbiased estimators of  $\theta$ , then  $y_n$  is more efficient then  $z_n$  if and only if  $\text{Var}(y_n) < \text{Var}(z_n)$ 

# Chapter 3

# Hypothesis Testing

### 3.1 Introduction

In hypothesis testing, we have a null-hypothesis  $H_0$  on a sample space  $\Omega$  and an alternative hypothesis  $H_1$  on  $\Omega$ . We want to test  $H_0$  against  $H_1$ .

To do so we consider a random sample size n and calculate the probability that  $H_0$  is within a certain *significane* level and deduce if we can accept  $H_0$ .

As an example consider  $H_0 = \mu \neq m$ , then  $H_1$  is

$$H_1 = \mu > m$$
  
 $H_1 = \mu < m$  One sided test  
 $H_1 = \mu \neq m$  Two sided test

Type I error

$$\alpha = \Pr(\text{Type I error}) = \Pr(\text{Reject } H_0 | H_0 \text{ is true}).$$

Type II error

$$\beta = \Pr(\text{Type II error}) = \Pr(\text{Accept } H_0 | H_0 \text{ is false}).$$

Power of the test

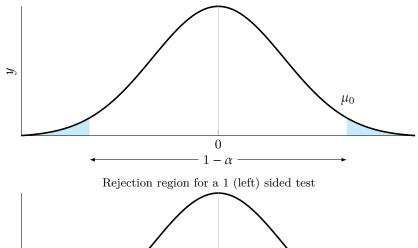

$$\pi = \begin{cases} \alpha & \text{if } H_0 \text{ is true} \\ 1 - \beta & \text{if } H_1 \text{ is true} \end{cases}$$

## 3.2 Comparison between a mean and a reference value

#### 3.2.1 Two sided test

$$H_0: \mu_0 = \mu$$
$$H_1: \mu_0 \neq \mu$$

|              | $H_0$ is true    | $H_0$ is false   |
|--------------|------------------|------------------|
| Accept $H_0$ | Correct decision | Type II error    |
| Reject $H_0$ | Type I error     | Correct decision |

Rejection region for a 2 sided test

• Assume  $\sigma$  is known. Test statistic  $T=\frac{\bar{x}_n-\mu_0}{\frac{\sigma}{\sqrt{n}}}.$ 

Rule of rejection

$$|T| > t$$
 
$$\begin{cases} \Pr(|T| > t) = \alpha \\ T \sim \mathcal{N}(0, 1) \end{cases}$$
.

• Assume  $\sigma$  is unknown. Test statistic  $T=\frac{\bar{x}_n-\mu_0}{\frac{S'}{\sqrt{n}}}=\frac{\bar{x}_n-\mu_0}{\frac{S}{\sqrt{n-1}}}.$ 

Rule of rejection

$$|T| > t$$
 
$$\begin{cases} \Pr(|T| > t) = \alpha \\ T \sim \mathcal{T}_{n-1} \end{cases}$$
.

#### 3.2.2 One sided test

Left sided test

$$H_0: \mu_0 = \mu$$
  
 $H_1: \mu_0 < \mu$ 

• Assume  $\sigma$  is known. Test statistic  $T = \frac{\bar{x}_n - \mu_0}{\frac{\sigma}{\sqrt{n}}}$ .

Rule of rejection

$$T > t \quad \begin{cases} \Pr\left(T > t\right) = \alpha \\ T \sim \mathcal{N}(0, 1) \end{cases} .$$

• Assume  $\sigma$  is unknown. Test statistic  $T=\frac{\bar{x}_n-\mu_0}{\frac{S'}{\sqrt{n}}}=\frac{\bar{x}_n-\mu_0}{\frac{S}{\sqrt{n-1}}}.$ 

Rule of rejection

$$T > t \quad \begin{cases} \Pr\left(T > t\right) = \alpha \\ T \sim \mathcal{T}_{n-1} \end{cases} .$$

#### Right sided test

Same as left sided test but with T < -t.

#### Comparison between a proportion and a reference value 3.3

#### 3.3.1 Two sided test

$$H_0: p_0 = p$$
$$H_1: p_0 \neq p$$

Test statistic  $X \sim \text{Bin}(n, p)$ .

Rule of rejection

$$\begin{cases} \Pr\left(X>b_{n,p_0,1-\alpha/2}\right) = \Pr\left(X>b_{n,p_0,\alpha/2}\right) = \frac{\alpha}{2} \\ X\sim \mathrm{Bin}(n,p_0) \end{cases}$$

Acceptance region  $[b_{n,p_0,\alpha/2},b_{n,p_0,1-\alpha/2}].$ 

$$\Pr\left(X \in [b_{n,p_0,\alpha/2}, b_{n,p_0,1-\alpha/2}]\right) = 1 - \alpha.$$

However if  $n \ge 30$  we can use the normal approximation. Test statistic  $T = \frac{X - np_0}{\sqrt{np_0(1-p_0)}}$ .

Test statistic 
$$T = \frac{X - np_0}{\sqrt{np_0(1 - p_0)}}$$
.

Rule of rejection

$$|T| > t \quad \begin{cases} \Pr\left(|T| > t\right) = \alpha \\ T \sim \mathcal{N}(0, 1) \end{cases}.$$

#### 3.3.2 One sided test

$$H_0: p_0 = p$$
  
 $H_1: p_0 < p$ 

Test statistic  $X \sim \text{Bin}(n, p)$ .

Rule of rejection

$$\Pr\left(X \geqslant b_{n,p_0,1-\alpha}\right) = \alpha.$$

Acceptance region  $[-\infty, b_{n,p_0,1-\alpha}]$ .

Normal approximation Test statistic  $T = \frac{X - np_0}{\sqrt{np_0(1-p_0)}}$ .

Rule of rejection

$$T > t \quad \begin{cases} \Pr(T > t) = \alpha \\ T \sim \mathcal{N}(0, 1) \end{cases}.$$

### 3.4 Comparison between a variance and a reference value

#### 3.4.1 Two sided test

$$H_0: \sigma_0^2 = \sigma^2$$
  
$$H_1: \sigma_0^2 \neq \sigma^2$$

Test statistic

$$T = \begin{cases} n \frac{Z^2}{\sigma_0^2} \sim {\chi_n}^2 & \text{if } \mu \text{ is known} \\ n \frac{S^2}{\sigma_0^2} \sim {\chi_{n-1}}^2 & \text{if } \mu \text{ is unknown} \end{cases}.$$

We reject  $H_0$  if  $T \notin [v_{\alpha/2}, v_{1-\alpha/2}]$ .

$$\Pr\left(T\notin \left[v_{\alpha/2},v_{1-\alpha/2}\right]\right)=\frac{\alpha}{2}.$$

#### 3.4.2 One sided test

$$H_0: \sigma^2 = \sigma_0^2$$

$$H_1: \sigma^2 > \sigma_0^2$$

Test statistic

$$T = \begin{cases} n \frac{Z^2}{\sigma_0^2} \sim {\chi_n}^2 & \text{if $\mu$ is known} \\ n \frac{S^2}{\sigma_0^2} \sim {\chi_{n-1}}^2 & \text{if $\mu$ is unknown} \end{cases}.$$

We reject  $H_0$  if  $T > v_{1-\alpha}$ .

$$\Pr\left(T > v_{1-\alpha}\right) = \alpha.$$

## 3.5 Critical Probability

$$\mathbf{P_c} = \begin{cases} \Pr\left(|T| \geqslant |t_0|/\theta = \theta_0\right) & \text{for one sided tests} \\ \Pr\left(T \geqslant t_0/\theta = \theta_0\right) & \text{for } H_1:\theta > \theta_0 \\ \Pr\left(T \leqslant t_0/\theta = \theta_0\right) & \text{for } H_1:\theta < \theta_0 \end{cases}.$$

# 3.6 Comparison between two means

#### 3.6.1 Two sided test

$$H_0: \mu_1 = \mu_2$$
  
 $H_1: \mu_1 \neq \mu_2$ 

Test statistic 
$$T=\frac{\bar{X}_1-\bar{X}_2}{\sqrt{\frac{\sigma_1^2}{n_1^2}+\frac{\sigma_2^2}{n_2^2}}}.$$

Rule of rejection

$$\begin{cases} \Pr(|T| > t) = \alpha \\ T \sim \mathcal{N}(0, 1) \end{cases}.$$

16

$$\begin{split} \bar{X}_1 - \bar{X}_2 &\sim \mathcal{N}\left(\mu_1 - \mu_2, \sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}\right) \\ \mathbb{E}(\bar{X}_1 - \bar{X}_2) &= \mu_1 - \mu_2 \\ \mathrm{Var}\left(\bar{X}_1 - \bar{X}_2\right) &= \frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2} \end{split}$$

#### 3.6.2 One sided test

$$H_0: \mu_1 = \mu_2$$
  
 $H_1: \mu_1 > \mu_2$ 

Test statistic same as before.

Rule of rejection

$$\begin{cases} \Pr\left(T > t\right) = \alpha \\ T \sim \mathcal{N}(0, 1) \end{cases}.$$

#### Note:-

If  $\sigma_1$  and  $\sigma_2$  are unknown, and  $\sigma_1 = \sigma_2$  we perform all the same preceding tests but this a new test statistic

$$T = \frac{\bar{X}_1 - \bar{X}_2}{S\sqrt{\frac{1}{n_1} + \frac{1}{n_2}}} \sim \mathcal{T}_{n_1 + n_2 - 2}.$$

if  $\sigma_1 \neq \sigma_2$  we use the preceding tests only if  $n_1$  and  $n_2$  are sufficiently large (> 30).

# 3.7 Comparison between 2 proportions

Consider the following 2 random variables

$$P = \frac{X + Y}{n_1 + n_2} \quad S_d^2 = P(1 - P) \left( \frac{1}{n_1} + \frac{1}{n_2} \right).$$

#### 3.7.1 Two sided test

$$H_0: p_1 = p_2$$
  
 $H_1: p_1 \neq p_2$ 

Test statistic  $T = \frac{\frac{X}{n_1} - \frac{Y}{n_2}}{S_d}$ .

Rule of rejection

$$\begin{cases} \Pr\left(|T| > t\right) = \alpha \\ T \sim \mathcal{N}(0, 1) \end{cases}.$$

#### 3.7.2 One sided test

$$H_0: p_1 = p_2$$
  
 $H_1: p_1 > p_2$ 

Same job as before.

## 3.8 Comparison between two variances

#### 3.8.1 Two sided test

$$H_0: \sigma_1^2 = \sigma_2^2$$
  
$$H_1: \sigma_1^2 \neq \sigma_2^2$$

Test statistic  $F = \frac{S_1^{'2}}{S_2^{'2}}$ .

$$F \sim \mathcal{F}_{n_1-1,n_2-1}.$$

where  $\mathcal{F}$  is the Fisher distribution.

Rule of rejection

$$\begin{cases} \Pr\left(F < f_{n_1-1,n_2-1,1-\alpha/2}\right) = \Pr\left(F > f_{n_1-1,n_2-1,\alpha/2}\right) = \frac{\alpha}{2} \\ F \sim \mathcal{F}_{n_1-1,n_2-1} \end{cases}$$

#### 3.8.2 One sided test

$$H_0: \sigma_1^2 = \sigma_2^2$$
  
 $H_1: \sigma_1^2 < \sigma_2^2$ 

Rule of rejection

$$\begin{cases} \Pr\left(F > f_{n_1-1,n_2-1,1-\alpha}\right) = \frac{\alpha}{2} \\ F \sim \mathcal{F}_{n_1-1,n_2-1} \end{cases}.$$

Note:-

Chi-squared test

 $H_0$ : the population follows law M

 $H_1$ : the population does not follow law M

Test statistic

$$Y = \sum_{i=1}^{k} \frac{(n_i - n_{p_i})^2}{n_{p_i}} \sim \chi^2_{k-1}.$$

Rule of rejection

$$\begin{cases} \Pr\left(Y>t\right) = \alpha \\ Y \sim \chi^2_{k-1} \end{cases}.$$

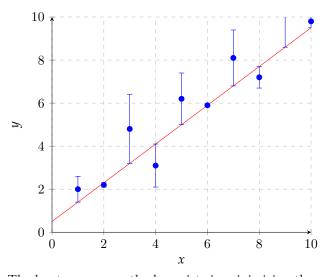

# Chapter 4

# Regression

$$cov(X,Y) = \mathbb{E}(XY) - \mathbb{E}(X)\mathbb{E}(Y).$$

# 4.1 Linear Regression

The objective of linear regression is to find the best linear approximation  $D: \alpha x + \beta$  of a set of data points.

The least squares method consists in minimizing the sum  $S(\alpha, \beta)$  of the squares of the residuals.

$$S(\alpha, \beta) = \frac{1}{n} \sum_{i=1}^{p} \sum_{j=1}^{q} n_{ij} (y_j - \alpha x_i - \beta)^2.$$

It can shown that the couple (a,b) that minimizes S is given by

$$a = \frac{\operatorname{cov}(X, Y)}{\operatorname{Var}(X)}$$
$$b = \mathbb{E}(Y) - a\mathbb{E}(X)$$

$$S_{\min} = \operatorname{Var}\left(Y\right) \cdot \left[1 - \frac{\operatorname{cov}\left(X,Y\right)^2}{\operatorname{Var}\left(X\right) \cdot \operatorname{Var}\left(Y\right)}\right].$$

Similarly, we can construct a regression line D': a'y + b' of y on x where a' and b' are given by

$$a' = \frac{\operatorname{cov}(X, Y)}{\operatorname{Var}(Y)}$$
$$b' = \mathbb{E}(X) - a'\mathbb{E}(Y)$$

# 4.2 Coefficient of linear correlation

$$\rho(X,Y) = \frac{\mathrm{cov}\left(X,Y\right)}{\sqrt{\mathrm{Var}\left(X\right)\mathrm{Var}\left(Y\right)}} = \frac{\mathrm{cov}\left(X,Y\right)}{\sigma_{X}\sigma_{Y}}.$$

Some properties of  $\rho(X,Y)$ 

$$\begin{split} &\rho(X,Y)^2\leqslant 1\\ &\rho(X,Y)^2=a\cdot a'\\ &\rho(X,Y)=\begin{cases} \sqrt{a\cdot a'} & \text{if } a,a'>0\,(\text{cov}\,(X,Y)>0)\\ -\sqrt{a\cdot a'} & \text{if } a,a'<0\,(\text{cov}\,(X,Y)<0)\\ 0 & \text{if } a=a'=0\,(\text{cov}\,(X,Y)=0) \end{cases}\\ &\rho(X,Y)\begin{cases} >0 & \text{if } X \text{ and } Y \text{ are positively correlated}\\ <0 & \text{if } X \text{ and } Y \text{ are negatively correlated}\\ =0 & \text{if } X \text{ and } Y \text{ are not correlated} \end{cases}\\ &\rho(X,Y)^2=1 & \text{if and only if } X \text{ and } Y \text{ are perfectly correlated} \end{split}$$
